

Experiment 9

PyTest Integration with HTML Reporting

This experiment converts a Selenium login script into a maintainable PyTest suite. It uses a fixture for browser lifecycle management, checks valid and locked-out login behavior on SauceDemo, and generates a self-contained HTML report.

Module	Unit Test Frameworks
Problem	Convert a Selenium setup into a maintainable PyTest suite.
Objective	Use a fixture for browser lifecycle management, test SauceDemo login behavior, and generate an HTML report.
Tools	Python 3.12+, Selenium WebDriver, PyTest, pytest-html, Google Chrome

1 Shared fixture

Create tests/conftest.py. The fixture starts a clean browser for each test, opens SauceDemo, yields the driver, captures evidence, and closes the browser even when a test fails.

```
import pytest
from pathlib import Path
from selenium import webdriver
from selenium.webdriver.chrome.options import Options

@pytest.fixture(scope="function")
def driver(request):
    options = Options()
    options.add_argument("--headless=new")
    options.add_argument("--window-size=1440,1000")
    options.add_argument("--disable-gpu")
    browser = webdriver.Chrome(options=options)
    browser.get("https://www.saucedemo.com/")
    yield browser
    Path("artifacts").mkdir(exist_ok=True)
    browser.save_screenshot(f'artifacts/{request.node.name}.png')
    browser.quit()
```

2 Login tests

```
from selenium.webdriver.common.by import By
```

```

def test_valid_login(driver):
    driver.find_element(By.ID, "user-name").send_keys("standard_user")
    driver.find_element(By.ID, "password").send_keys("secret_sauce")
    driver.find_element(By.ID, "login-button").click()
    assert "inventory.html" in driver.current_url

def test_invalid_login(driver):
    driver.find_element(By.ID, "user-name").send_keys("locked_out_user")
    driver.find_element(By.ID, "password").send_keys("secret_sauce")
    driver.find_element(By.ID, "login-button").click()
    message = driver.find_element(By.CSS_SELECTOR, "h3[data-test='error']").text
    assert "locked out" in message.lower()

```

3 Execute and report

From the project folder, install the requirements and run:

```

python -m pip install -r requirements.txt
python -m pytest tests --html=reports/test_report.html --self-contained-html -v

```

The report should show two collected tests. The browser fixture also writes final-state screenshots to the artifacts folder.

```

from selenium.webdriver.common.by import By

def test_valid_login(driver):
    driver.find_element(By.ID, "user-name").send_keys("standard_user")
    driver.find_element(By.ID, "password").send_keys("secret_sauce")
    driver.find_element(By.ID, "login-button").click()

    assert "inventory.html" in driver.current_url

def test_invalid_login(driver):
    driver.find_element(By.ID, "user-name").send_keys("locked_out_user")
    driver.find_element(By.ID, "password").send_keys("secret_sauce")
    driver.find_element(By.ID, "login-button").click()

    error_message = driver.find_element(By.CSS_SELECTOR, "h3[data-test='error']").text
    assert "locked out" in error_message.lower()

```

```

```

4 Verification performed

Check	Observed result
Valid login	SauceDemo navigated to /inventory.html in the browser surface.
Invalid login	SauceDemo displayed: “Epic sadface: Sorry, this user has been locked out.”
Local Selenium run	ChromeDriver resolved, but the sandbox blocked Chrome profile startup; the failure is recorded rather than presented as a passing run.

Conclusion

The exercise preserves the original learning objective while making the fixture, assertions, reporting command, and evidence collection complete and repeatable.
